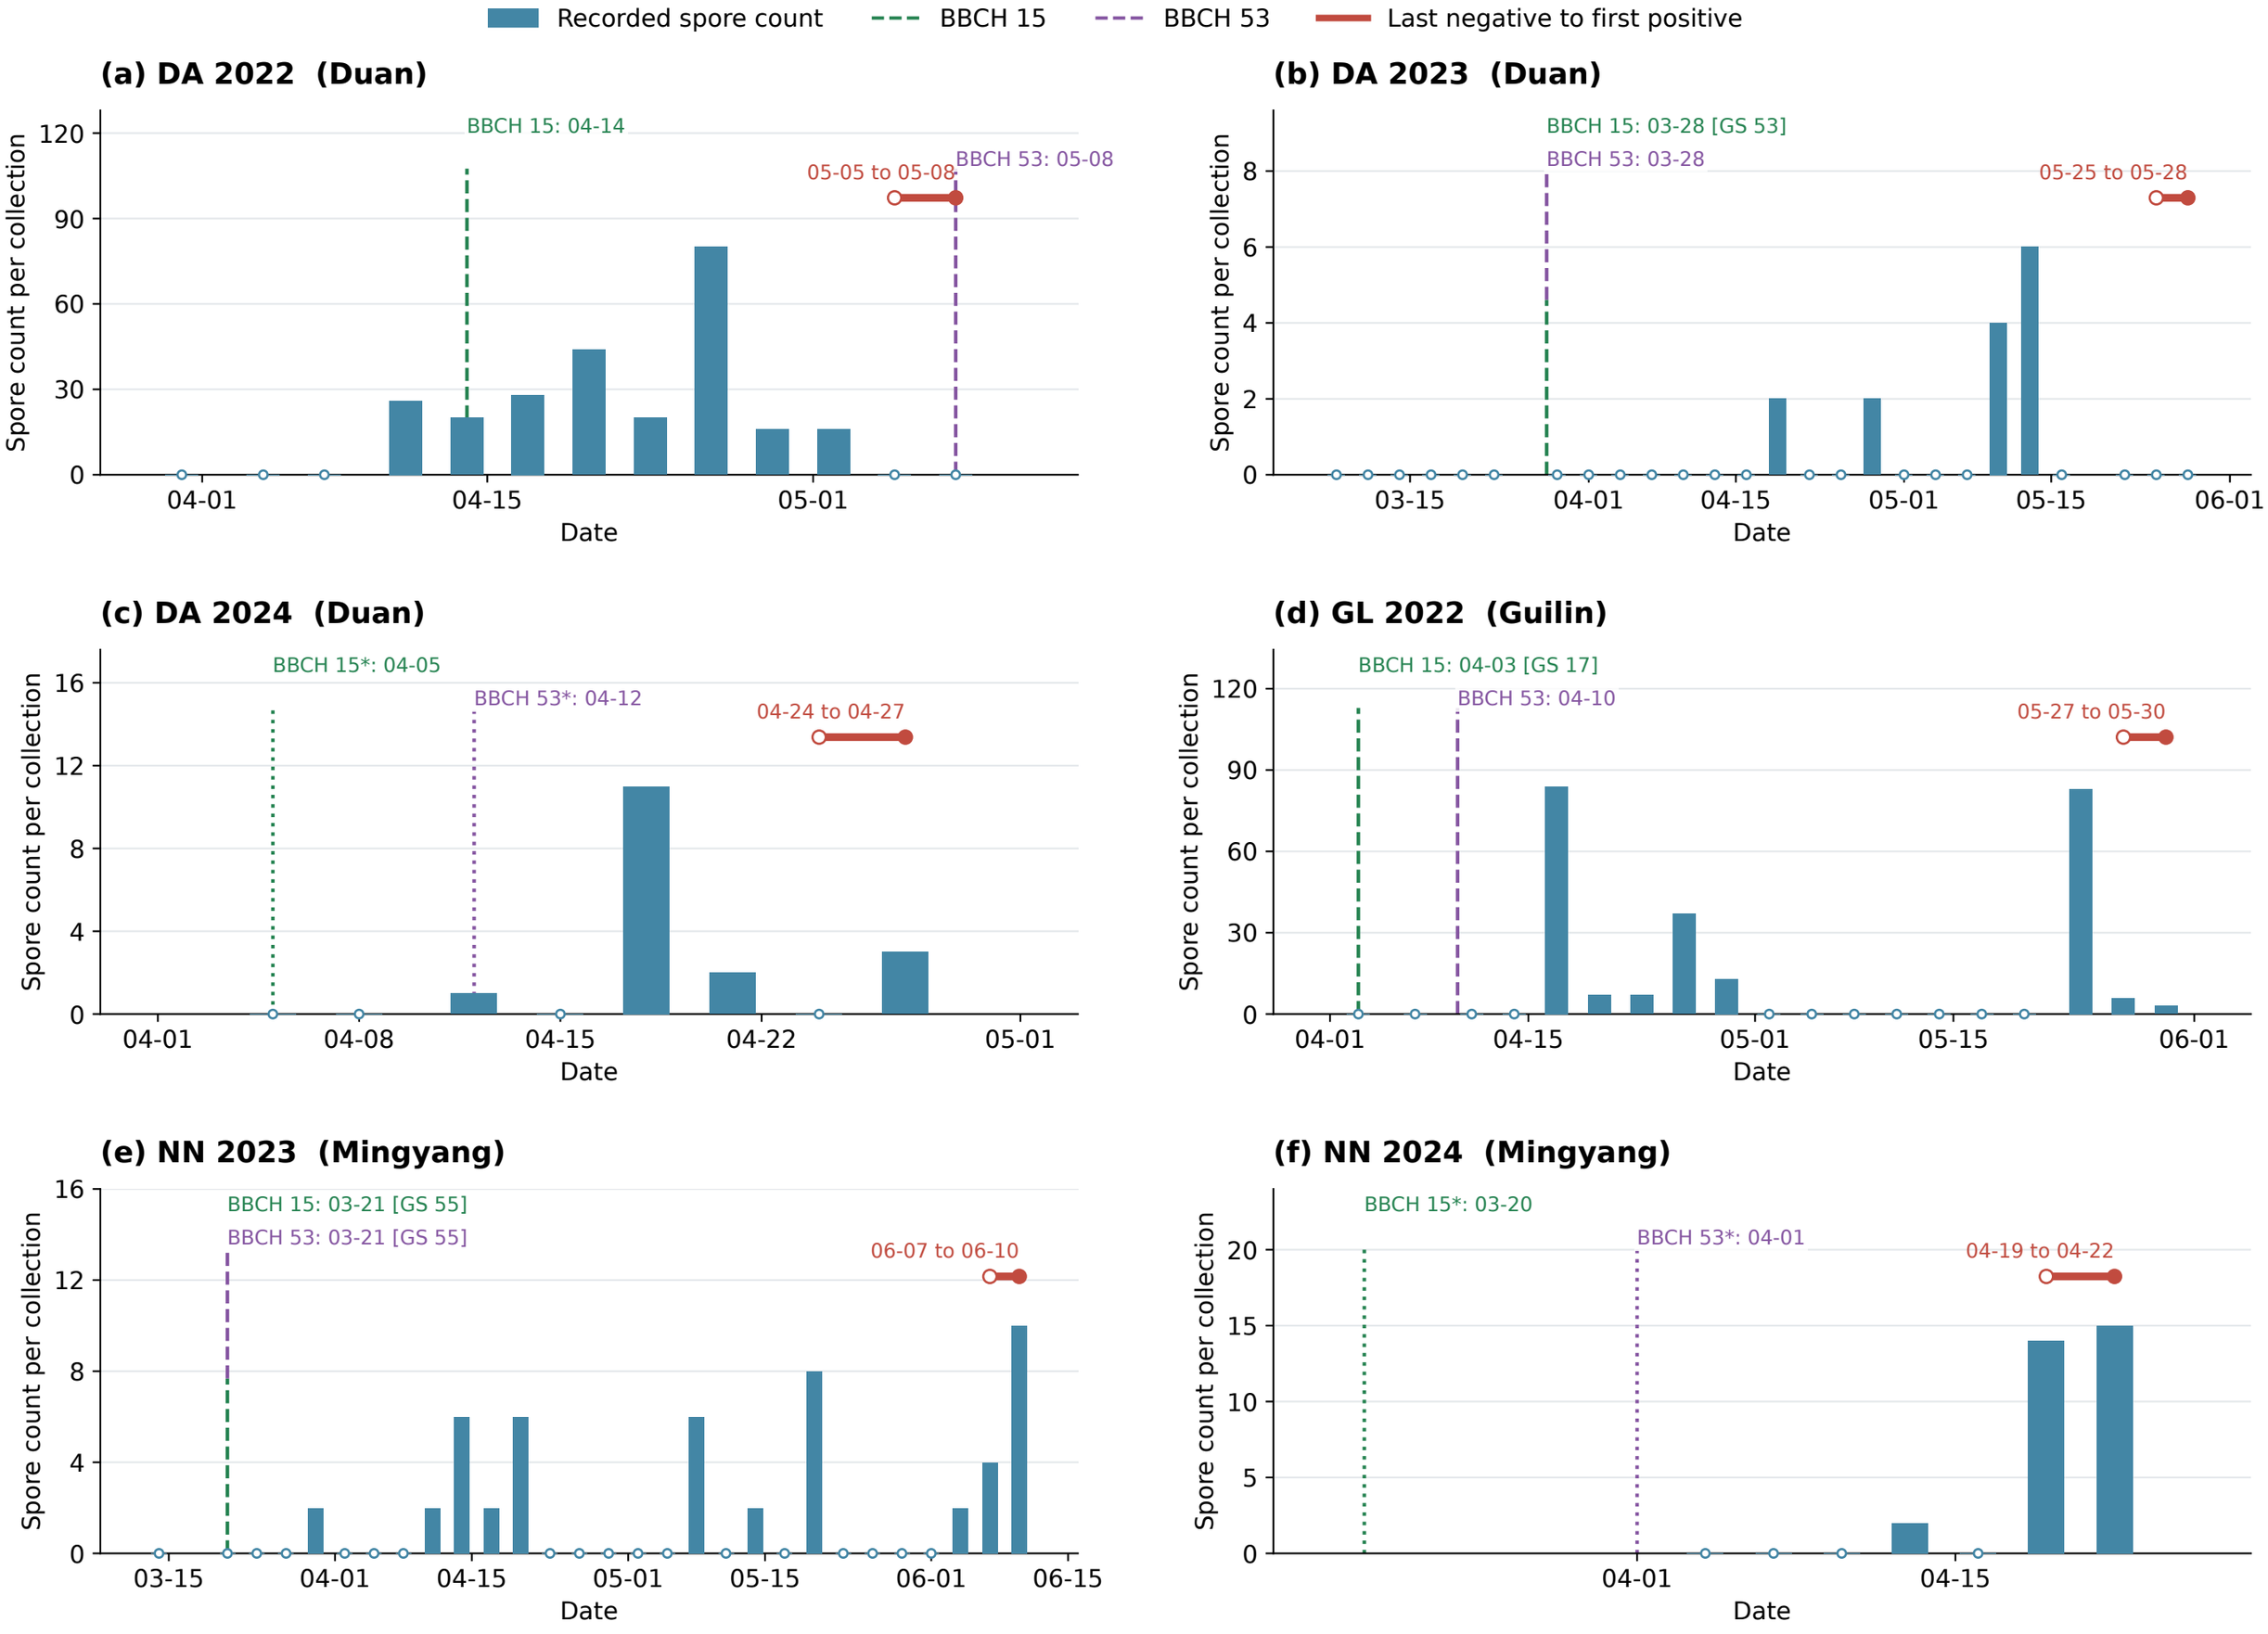
Observed spores, phenology and disease onset



Bars: raw counts at recorded collection dates; no daily interpolation. Open blue circles: observed zeros. Panel scales differ.
Red segment: observed disease-onset interval (open endpoint = last negative; filled endpoint = first positive); height is illustrative.
Phenology: first recorded GS reaching or exceeding each stage; brackets show a higher recorded GS. Coincident dates share a split vertical line.
* Dotted lines: 2024 phenology from A-run inputs because GS is absent in the workbook.
